## OPEN LETTER TO PHYSICIANS

Esteemed Colleague:

For the past 16 years, I have been honored to care for patients in times of critical need in the emergency setting. I have addressed their urgent problems and returned them to your watchful care. I encounter many patients who suffer from diabetes and the resulting negative sequelae. When I learned of an innovative approach in treating metabolic failure, I wanted to bring this modality to clinicians to improve the lives of their patients. Diabetes Relief restores insulin sensitivity and promises to improve, and in some cases reverse, many of the most troubling complications of this disease.

The epidemic of diabetes continues to grow and exact a tremendous toll. Current treatments offer symptom suppression but do very little to address the underlying problems that result in patients developing insulin resistance. Do you have patients who develop complications of diabetes despite your best efforts with conventional therapy? Do you worry about high-risk patients facing the prospect of amputation with poorly healing wounds? Are you concerned with patients facing dialysis as their nephropathy marches steadily forward? Are you frustrated with limited options for patients suffering from chronic pain secondary to diabetic neuropathy?

We use FDA-approved devices and a patented protocol to couple today's technology with scientific principles known for decades. We believe our approach represents an enormous step forward in the treatment of diabetes and other metabolic disorders. As insulin sensitivity improves, patients' medical profiles improve using our dynamic delivery of insulin, the undisputed gold standard in diabetes care. It is important to understand that, just as a physical therapist works with an orthopedic surgeon, our goal is to complement existing treatments. We hope to work in concert with you to combat the myriad complications that result from diabetes. Feel free to call me to discuss if Diabetes Relief's therapy might be right for your patients. As you review the enclosed White Paper and explore our Website, questions are welcome.

Respectfully,

Brian Loveridge M.D.
